Unit-wise questions - Microprocessor

Syllabus | Questions & solutions | Text & reference books

Discrete Structures | Object Oriented Programming | Microprocessor | Mathematics II | Statistics I

Unit: 1 Introduction 7 questions

Unit: 2 Basic Architecture 35 questions

Unit: 3 Instruction Cycle 13 questions

Unit: 4 Assembly Language Programming 54 questions

3. Explain LXI and CMP instruction. Write an assembly language program for 8 bit microprocessor to divide 8 bit data stored in memory location 8050 by 8 bit data stored in 8051 and store the quotient in 8052 and remainder in 8053. [3+7]	asked in 2078
2. Ten number of 8-bit data stored at memory location 6000H. Write a program for 8085 microprocessor to calculate the sum of odd numbers and store the sum of odd numbers and store the sum at 6010H.(The sum may exceed 8-biys).	asked in 2074
2. Write a program in 8-bit microprocessor to multiply two 16-bit numbers and store in the memory location starting from 3500H. Save the carry bits in the location starting from 3600H.	asked in 2071
2. Write an assembly language program for 8086 microprocessor to read a string from keyboard and display each word in separate line. The length of input string can be up to 60 characters.	asked in 2070
3. Write an assembly language program to sort an array in ascending order using 8 bit microprocessor. (Assume appropriate array data and address where minimum array size of 10 should be considered).	asked in Model Question
3. Write a program in 8-bit Microprocessor to store 60h, BAh, 7Ch and 10h in the memory location starting from 2000h. add these data and store the result in 3000h and carry flag in 5001h. explain all the steps.	asked in 2066
3. Write a program in 8-bit Microprocessor to multiply two 16 bits numbers (ABCDh and 1234h) and store in the memory location starting from 3000h.	asked in 2067
3. Describe different types of 8085 instructions sets, based on word size, with suitable examples. Write instructions to load two hexadecimal numbers 32H and 48H in register A and B respectively. Add the numbers and display the sum at the LED output port PORT1.	asked in 2072
3. What are the instructions available in 8085 microprocessor for arithmetic and logic operation? Explain each with example. Also mention, how the flags are affected by each instruction.	asked in 2074
3. Write a program in 8-bit Microprocessor to multiply two 16 bits numbers and store in the memory location starting from 3500h. Save the carry bits in the location starting from 3600h.	asked in 2065
3. Write a program in 8-bit Microprocessor to store 68h, B3h, C Oh, and 11h in the memory location starting from 3000h. Move these data and store in the memory location starting from 3200h.	asked in 2068
3. List out the instruction for arithmetic and logic operation in 8085 microprocessor and explain with example. Also mention the effect on flags by each instruction.	asked in 2070
3. Write a program in 8-bit Microprocessor to store 45h, A0h, B5h and 15h in the memory location starting from 4000h. Add these data and store the result in 5000h and carry flag in 5001h.	asked in 2069
3. Write an assembly language program to find the smallest number in an array using 8 bit microprocessor. (Assume appropriate array data and address where minimum array size of 15 should be considered.)	asked in 2075
3. Write an assembly language program to find the greatest number in an array in using 8 bit microprocessor. (Assume appropriate array data and address where minimum array size of 20 should be considered.)	asked in 2076
5. Specify the output in PORT1 after the execution of the following program. Write comments for each instruction. MVI A, AAH MOV B, A RRC	asked in Model Question

XRA B

OUT PORT1

HLT

4. What do you understand by POP operation? Explain the use of POP operation in the case of stack.	asked in 2069
4. Differentiate between PUSH and POP operations. Write a program to illustrate the use of PUSH operations.	asked in 2065
4. What do you understand by PUSH operation? Explain the use of push operation in the case of stack.	asked in 2068
6. Differentiate between PUSH and POP instruction with example illustrating the use of these instructions.	asked in 2078
5. Write an assembly language program to multiply 05h and 06h. Explain all the steps.	asked in 2066
5. Write an assembly language program to multiply two numbers.	asked in 2069
5. Write an assembly language program to add two 16-bit numbers.	asked in 2068
5. Write an assembly language program to subtract two 16-bit numbers.	asked in 2065
7. Write an assembly language program for 16 bit microprocessor to reverse the string "This is Microprocessor".	asked in 2078
5. Write an assembly language program to add two 16-bit numbers (3467h and ACDCh).	asked in 2067
8. Write a program to reverse a given a string using 16 bit microprocessor.	asked in Model Question
6. Observe the following program and write the content of Accumulator, register B and flags after execution of each instruction.(assume initially all flags are reset) MVI A, 59H MVI B, 67H ADD B ANI 3AH HLT	asked in 2074
6. What is a macro assemblers? Explain it.	asked in 2066
5. Write an ALP for 8086 to read string and print it in the reverse order.	asked in 2076
7. The contents of the accumulator are 93H and the contents of register C are B7H. Explain the status of different flags after adding the content of registers A and C.	asked in 2071
7. What is CALL operation? How it differs with JUMP operation? Explain.	asked in 2074
7. Define stack. Write programs to illustrate PUSH and POP operations.	asked in 2072
7. Explain different types of I/O instructions used in 8-bit microprocessor.	asked in 2067
6. Write an ALP for 8086 to read a string and display the string in uppercase.	asked in 2075
8. Write a program in 8085 microprocessor to subtract 16 bit number at 2000H from a 16 bit number at 2010H and store the result at 2020H.	asked in 2070
6. Differentiate between PUSH and POP instruction with example illustrating the use of these instruction.	asked in 2076
9. Write an assembly language program for 8086 microprocessor to display"Computer Science and Information Technology" .	asked in 2074
12. Write Short Notes (Any Two): a) Macro Assembler b) BSR Mode c) System Bus	asked in Model Question
10. Write an assembly language program to subtract two 16-bit numbers.	asked in 2071
10. Observe the following program and write the content of Accumulator, register B and flags after execution of each instruction. (assume all flags are reset). MVI A, 45H MVI B, 66H	asked in 2070

ADD B

ANI 63H

HLT

8. What is CALL operation? How does it differ with JUMP operation?	asked in 2076
11. Write an assembly language to display a string “I want to know more about microprocessor” using 16 bit microprocessor code. Assume any necessary data.	asked in 2066
9. What is instruction set? Explain various kind of instructions of 8085 microprocessor.	asked in 2075
11. What do you understand by assembler directives? Explain with suitable examples.	asked in 2072
11. Write an assembly language program to display a string "This is a test program" using 16 bit microprocessor code. Assume any necessary data.	asked in 2069
12. Discuss ADD, MUL and DIV instruction of 8086 with suitable examples.	asked in 2070
12. Write and explain assembly language program to multiply 05H and 06H.	asked in 2072
13. Write an assembly language program to display a string “Microprocessor programming is a fun” using 16 bit microprocessor code. Assume any necessary data.	asked in 2068
13. Write an assembly language to display a string “I like programming in the assembly language” using 16 bit microprocessor code. Assume any necessary data.	asked in 2067
13. Differentiate between PUSH and POP operations with suitable example.	asked in 2066
13. What do you understand by macro assembler? Explain.	asked in 2071
13. Write an assembly language to display a string “Assembly language coding is difficult” using 16 bit microprocessor code. Assume any necessary data.	asked in 2065
11. What is instruction set? Explain various Kinds of instructions of 8086 microprocessor.	asked in 2076

Unit: 4 Basic I/O, Memory R/W and Interrupt Operations 27 questions

Unit: 6 Input/ Output Interfaces 15 questions

Unit: 7 Advanced Microprocessors 8 questions

Unit: 8 Old Syllabus 6 questions
